

Technical Web Audit

What it reviews, what it delivers and how it helps turn a website into a more reliable lead generation system.

Product from 399 USD - delivered in 3 days

tallerdedigitalizacion.com

Performance and mobile experience	Technical SEO and tracking
Forms and conversion	Security, infrastructure and continuity

A website is not a business card. It is a lead generation system.

1. What a Technical Web Audit is

A Technical Web Audit is a full diagnosis of the website as a lead generation system. It does not only check whether the website looks good or whether the copy is polished. It reviews whether the technical foundation can turn traffic into real opportunities: speed, mobile experience, forms, technical SEO, security, infrastructure, backups, change process and tracking.

Core idea

The audit does not start by asking what technology you use. It starts by asking what the website is supposed to achieve and what may be preventing that goal from happening.

2. When it makes sense

Symptom	What may be happening
You pay for ads, but get few contacts	The page may be slow, weak on mobile, poorly tracked or too hard to contact from.
You get visits, but do not know which channel converts	There is no clear connection between traffic, forms, CRM, email or WhatsApp.
Every website change feels risky	There may be no staging, tested backups, version control or technical process.
The website is slow or weak on mobile	Hosting, cache, images, scripts, database or architecture may be limiting the experience.
You are not sure forms work	Lead generation may be broken without anyone noticing.
The website grew without a technical map	Technical debt, accumulated plugins, fragile infrastructure or old decisions may now be slowing the business down.

3. What the audit reviews

Area	What is reviewed
Acquisition and business	Website goal, business type, paid traffic, acquisition channels and the link between visits and opportunities.
Performance and experience	Mobile and desktop speed, Core Web Vitals, cache,

	CDN, resource weight and real user experience.
Basic technical SEO	Indexing, Search Console, HTTPS, technical structure, visible errors and signals that may limit organic presence.
Conversion and forms	Calls to action, form functionality, lead destination, confirmations, tracking and contact friction.
Security	Admin access, 2FA, bot protection, exposed login, CMS/plugins/dependencies and visible risks.
Infrastructure and continuity	Hosting, server, database, backups, restore, staging, provider, cache, CDN and recovery capacity.
Technical governance	Ownership, change process, versioning, basic documentation and how the website is operated without improvisation.

4. What the company receives

Technical diagnosis

A clear reading of the current state of the website, without hiding problems behind jargon.

Area-based score

Separate scoring for acquisition, performance, technical SEO, forms, security, infrastructure and governance.

Prioritized roadmap

A ranked list of actions based on impact, urgency, risk and effort.

Detected risks

Issues that may affect lead generation, security, continuity or return on investment.

Technical recommendation

A practical recommendation: repair, simplify, migrate, redesign or maintain with specific adjustments.

Implementation options

The company can execute with its own team, receive technical guidance or hire the implementation.

5. How the work is done

Step	Description
1. Context	A short session to understand the business, website goal, acquisition channels and perceived issues.
2. External review	Speed, mobile, visible technical SEO, forms, basic security and public behavior.
3. Technical review	When relevant, CMS, hosting, infrastructure, backups, staging, analytics and change process.
4. Diagnosis	Separation between critical issues, recommended improvements and low-impact details.
5. Roadmap	Delivery of prioritized actions and possible execution paths.

6. What it does not include

Not included	Why
Automatic implementation	The audit diagnoses. Execution is defined later, if it makes sense.
Sales promises	The audit improves the technical foundation for lead generation, but it does not control market, offer or demand.
Full content SEO strategy	It does not replace editorial strategy or link building. It reviews the technical foundation so that investment is not wasted.
Full visual redesign	It may be recommended, but it is not the default starting point.

7. Expected outcome

Outcome

By the end of the audit, you should know what is failing, what impact it has, what should be fixed first and whether it makes sense to invest in repair, migration, redesign or guided implementation.

The next decision can follow three paths: your team implements it, I guide your team, or Taller de Digitalización executes the implementation. The audit exists so that this decision is not made blindly.

8. Review call

If you received this document with your self-assessment result, you can book a 15-minute call to review whether a full audit makes sense for your case: [Book a call](#)

Commercial criterion

If there is no clear room for improvement, we say so. The audit only makes sense when it can reduce technical uncertainty or uncover real lead generation losses.

Executive summary

Product	Detail
Technical Web Audit	Full diagnosis of the website as a lead generation system.
Price	From 399 USD.
Delivery	3 days from receiving the necessary access and context.
Format	Short sessions, technical review, executive report and prioritized roadmap.
Next step	15-minute call to validate whether moving forward makes sense.
